

Team 20 Project Charter

BoilerStudy

Team Members:

Manya Gupta, Emma Jiang, Pawani Surthi, Lizzy Zhou

Project Title:

BoilerStudy (name might change later)

Problem Statement:

There are a lot of applications to support studying, such as Quizlet, Anki, and RemNote, but they all have differing and scattered features, lack standardization and organization, and are often blocked or limited behind ads and paywalls. We want to make a centralized study application with quality tools focused on deep learning, make study materials available in one spot, and encourage student interaction and collaboration. With tools like flashcards, study guides, and practice tests supplemented with generative AI, as well as a shared resource drive and study group matching, students can now do all of their studying in one streamlined app.

Project Objectives:

1. Build a platform for people to share resources, match with study groups, and create study materials for classes within their specific school community
2. Offer several options for methods of studying, from test-generating to game-playing
3. Provide user features including account creation and authentication, profile editing, and personal statistics relating to time studied, study streaks, etc.
4. Keep and improve upon some features of major study softwares like Quizlet, while also adding newer features and keeping the application free

Stakeholders:

Users: Users can include students in university classes, students who want to study with a variety of methods, students searching for study groups, and students searching for course resources

Developers: Manya Gupta, Emma Jiang, Pawani Surthi, and Lizzy Zhou

Project Manager: Alina Li

Project Owners: Manya Gupta, Emma Jiang, Pawani Surthi, and Lizzy Zhou

Deliverables:

- A frontend that allows users to find and upload study materials, create and customize their profile, communicate and share resources with peers, and provide study tools for studying flashcard sets
- A Java (Springboot)-based backend that will handle network requests, make relevant API calls and manage user and system data

- A SQL (Postgres) database that stores and manages system and user data and their created/uploaded study materials
- An interface for signing up and logging into the application, as well as user profile modification
- An interface for joining a university and its classes, with the ability to upload materials and resources to a shared drive

Frameworks & Platforms:

- React (JS) for Frontend Application
- Java (Springboot) for Backend
- SQL (Postgres) for Database
